8:30 AM - 12:00 PM Tutorial @Suite 112

### Tutorial 1: Computational Drug Target Prediction: Benchmark and Experiments, by **Dr. Nansu Zong and Dr. Victoria Ngo**

Abstract: In the tutorial, the participants will firstly theoretically review the history of computational drug target prediction. The methods, datasets, and how the experiments are designed will be introduced. Later, the participants will be introduced to a data set, Linked Multipartite Network (LMN), a heterogeneous network that incorporates 12 repositories and includes 7 types of biomedical entities (#20,119 entities, # 194,296 associations). The participants will learn how to use LMN to facilitate drug target prediction, including computational validation, and facilitate scientific discovery. Finally, participants will be introduced to some state-of-the-art computational methods, and practice the adoption of these methods to conduct the experiments by running the tasks with the given training and testing files generated in the LMN.

10:00 - 10:30 AM @Suite 104

## Coffee Break

Full-day Tutorial @Suite 113

### Tutorial 2: Prescriptive Healthcare Analytics: a Tutorial on Discrete Optimization and Simulation, by **Dr. Elizabeth M. Williams, Dr. Paul R. Harper and Daniel Gartner**

Abstract: There has been recognition of the role that mathematical modelling and Operational Research (OR) have to play in decision making in healthcare. For the last 20 years and even more so than during the recent pandemic, mathematical models have been used for demand and capacity planning across many healthcare services including primary, secondary care and healthcare logistics. In this tutorial, we will provide an overview of different mathematical modeling techniques applied to healthcare but with a particular focus on two paradigms: Discrete Optimization as part of Mathematical Programming and Discrete Event Simulation. Participants will learn how to formulate models mathematically, implement them in Microsoft Excel and use non-commercial solvers to provide solutions of the models. Because in this first part, rather deterministic models are presented, we will introduce the concept of variation in a second part using Discrete Event Simulation.

12:00 - 1:00 PM @Suite 104

## Lunch

1:00 - 4:30 PM Tutorial @Suite 112

### Tutorial 3: Data Science for Healthcare via an E-Learning Statistics Platform, by **Dr. Philipp Burckhardt, Dr. Saba Al-Sayouri and Dr. Rema Padman**

Abstract: In this tutorial, participants will discover how the ISLE e-learning platform can be used to deliver health informatics and analytics instruction. Tutorial attendees will learn how to build lessons with ISLE through the accompanying authoring tool and how to monitor student progress and performance. In addition, we will discuss how to use clickstream data to improve material on the fly and iteratively improve subsequent lessons. No matter the mode of delivery, attendees will leave with a clear understanding of how to leverage hands-on activities and data analysis exercises to foster understanding of statistical concepts and skills.

**Keynote: Towards Impactful Clinical Evidence Powered by Informatics and Data Science, by Dr. Chunhua Weng**

Abstract: Robust clinical evidence is the foundation to evidence-based medicine (EBM). However, our clinical research enterprise faces multiple challenges and the PubMed evidence base is fraught with free-text evidence of mixed quality, preventing evidence adoption among clinicians and reducing the trust in science among patients.

In this talk I will provide a high-level overview of my lab's research on developing informatics and data science methods to improve the impact of clinical evidence resulting from clinical trial research, spanning the continuum from evidence generation to evidence dissemination. I will cover issues such as informatics-based diversity optimization for clinical research enrollment, data-driven eligibility criteria optimization, scalable clinical evidence extraction and representation, and automated conflicting evidence detection for published clinical trial studies. I will conclude with research opportunities to develop informatics and data science methods to improve the robustness and computability of clinical evidence.

**Keynote: Leveraging Digital Therapeutics for Health Literacy: A Systems Perspective, by *Dr. Rema Padman***

Abstract: Health literacy is a widely recognized challenge for public health, with many adults lacking the requisite skills to engage successfully in the management of their health and healthcare. Affecting both individual and societal health outcomes, it particularly exacerbates the increasing physical and psychological burden for patients with multiple health conditions as well as the elderly and disadvantaged populations. Recent developments in digital therapeutic solutions offer an opportunity to apply systems thinking and perspectives to synthesize the myriad components of a multi-pronged approach to improving societal health literacy at scale. This talk will highlight some of these developments with a focus on digital platforms and algorithmic artifacts in the healthcare delivery setting, recognizing the challenges of misinformation and disinformation in identifying and disseminating authoritative and accurate content for educating and empowering patients and the public.

**Keynote: Designing Health IT to Support Team Cognition and Clinical Work: A Human Factors and Socio-Technical Systems Approach, by Dr. Ayse P. Gurses**

Abstract: Health care is increasingly provided in team-based environments, yet little is known about how to design health IT solutions that support care team members' cognition (e.g., information needs, problem detection, communication, coordination, etc.) and clinical work. This is especially true for time-pressured, high-risk, high stakes care situations such as trauma care that involves multiple specialties, and is

provided in multiple care locations (e.g., trauma bay, operating room, intensive care unit). In this presentation, I will first discuss how we used a human factors and a socio-technical systems approach to characterize the team work involved in caring for pediatric trauma care patients, including barriers to and enablers for team cognition. I will then describe the human-centered design approach we used to develop a team-centric health IT to support pediatric trauma care. Finally, I will conclude my talk with some health IT design considerations and recommendations for supporting health care team work and 'lessons learned' from our human-centered design process.

**Keynote: Toward a Learning Health System: Enabling the National Knowledge Ecosystem at Scale,**  
 by **Dr. Blackford Middleton**

Abstract: In this talk, Dr. Middleton will highlight the essential informatics building blocks of an enabled Learning Health System, and key AI-driven components. He will talk first about modern clinical information needs, his early experiences building CDS tools in EHR, the central problem of knowledge exchange between EHRs, and the concerns regarding

evaluation of a man-machine (AI)-patient triad in decision making going forward. If a shared vision is adopted across industry and academe, and enabled, he will describe one possible result: a National Knowledge Ecosystem to support a LHS.
